

Acceptance of Climate-Oriented Housing Policies – A Comparison between Owners and Tenants in Germany

Speaker: Tom Schütte¹

Co-Authors: Thilo Haverkamp², Heike Wetzel¹, Andreas Ziegler²

University of Kassel

¹ Applied Microeconomics and Empirical Energy Economics Unit

² Empirical Economic Research Unit

IAEE Milan, July 2023

Motivation (1) – Policy acceptance

- **Why study policy acceptance?**
- The German buildings sector is a large contributor to CO₂ emissions in Germany (Umweltbundesamt 2022)
- Several climate-oriented housing policies are discussed and implemented in Germany
- Public acceptance is important for the implementation and effectiveness of climate-oriented policies (e.g., Attari et al. 2009)

Figure 1: „Yellow Vest“ protest. (Source: Eric Feferberg, AFP)

Motivation (2) – Owners' and tenants' preferences

- **Why compare owners' and tenants' preferences?**
- Owners and tenants are affected differently by individual policies
- The majority (53%) of the German population are tenants (Eurostat 2022)
- The rental housing market is tense: Increasing rents, energy costs, and influx of people
- The average household spends 25% of its income on housing expenses (Statistisches Bundesamt 2023)

→ **Possible differences in policy-preferences**

Hypotheses: Policy types

Voluntary (pull) or regulatory (push)

- The literature shows that voluntary climate-oriented policies are generally preferred over regulatory policies (e.g., Drews & Van den Bergh 2016)
- *H1: Voluntary pull-policies are preferred over regulatory push-policies*

Eco-social policies are preferred by tenants

- Eco-social policies are policies that are designed to reach environmental as well as social goals (e.g., Mandelli (2022), Gugushvilli & Otto 2021)
- Social housing policies are usually “tenant-friendly”
- *H2: Tenants are more likely to accept eco-social policies than owners*

Hypotheses: Owners and tenants

Property ownership reduces acceptance for push policies with high perceived costs

- Push policies often come with highly visible costs for property owners
- *H3: Tenants are more likely to accept costly push policies than owners*
- *H4: Being a landlord makes tenants less likely to accept costly push policies*

The home type affects policy acceptance

- Owner-occupied multi-family homes (MFH) are lacking behind single-family homes (SFH) in energy efficiency-related investments because of coordination issues among the apartment owners
(März et al. 2020, Feuersänger 2017)
- *H5: Owners in MFH are more likely to accept costly push policies compared to owners in SFH*

Contribution of this study

1. Empirical analysis of determinants for pro-environmental behavior (policy acceptance)
2. To our best knowledge, one of the first studies to explore potential differences in preferences for climate-oriented housing policies between homeowners and tenants (e.g., Jansma et al. 2020)
 - Basis: Representative sample (in terms of age, gender, and state of residence) of more than 5,000 household decision makers in Germany
 - About 2,200 owners and 2,900 tenants
 - Survey conducted in 2022 by a market research institute

Dependent variables: 8 policies

		= 1		= 2	= 3	
Policies		Completely disagree	Rather disagree	Undecided	Rather agree	Completely agree
6 push policies	Ban new oil heating systems	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	Ban new gas heating systems	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	Ban non-energy efficient apartments (Eco-social)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	Mandatory solar panels on residential buildings	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	Banning the construction of new single-family homes (Eco-social)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	Banning empty apartments (Eco-social)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2 pull policies	Subsidy on household battery systems	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	Subsidy on household energy efficiency measures	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

- 8 three-alternative ordinal variables → Multivariate ordered probit model

Explanatory variables

- Derived using the ABC-model (Stern 2000) and a literature review
- **Variables of interest:**
 - **Tenant (0/1)**
 - **Landlord (0/1)**
 - **Home type**
 - MFH
 - Attached SFH
 - Detached SFH

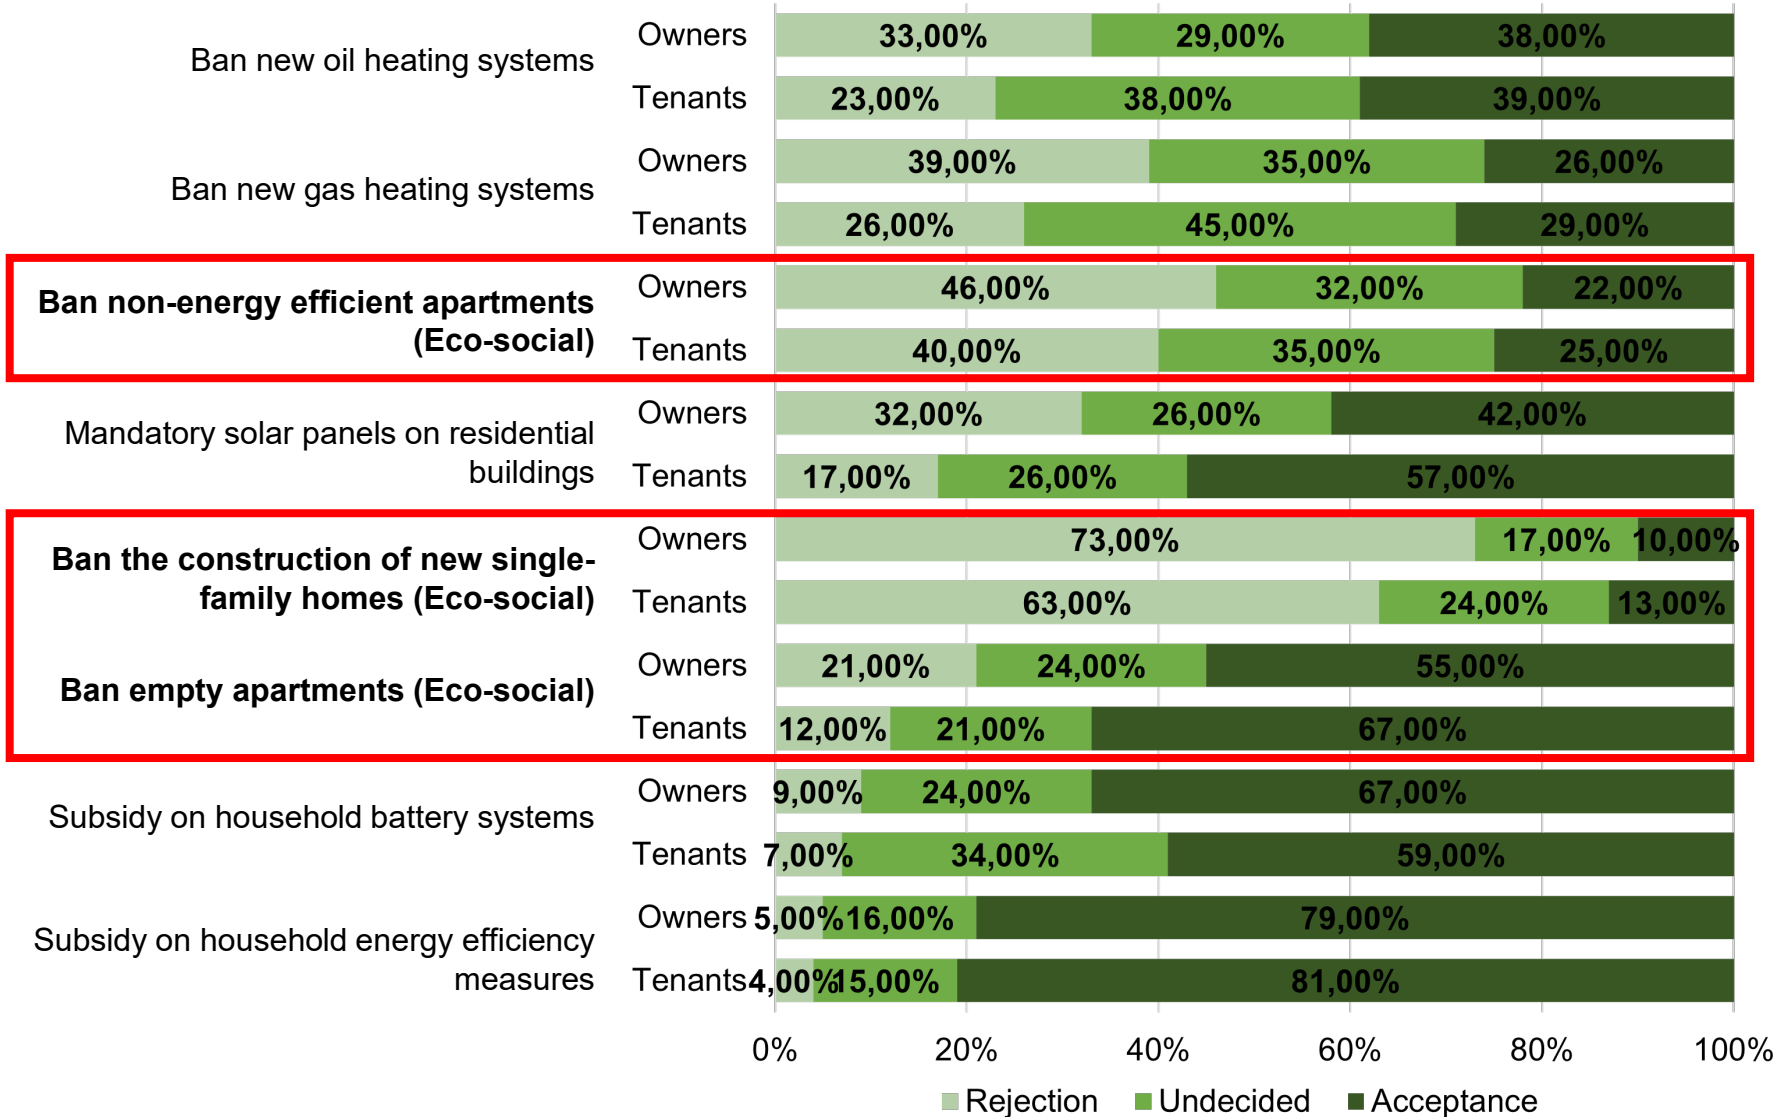

Main variables of interest	Attitudinal factors	Contextual factors	Personal capabilities	Additional controls
Tenant	Altruism	Catholic environment	Age	Member of environmental organization
Landlord	NEP score	Left-wing political environment	Gender	Eastern Germany
Home type	Climate change beliefs	Peer pressure	Education	Worrying about consequences of war in Ukraine
	Political identification	General trust	Household income	
		Trust in politics	Employment status	
			Kids	

Table 1: Explanatory variables

Results: Pull vs. push policies

Results: Eco-social policies

H2: Tenants are more likely to accept eco-social policies than owners

Eco-social policies average acceptance:
Owners: 29%
Tenants: 35%

Results: Differences between owners and tenants

H3: Tenants are more likely to accept costly push policies than owners

- Tenants are more likely to accept almost all policies
- Largest effect: Mandatory solar panels for residential buildings (+15%)

Figure 2: Estimated average discrete probability effects of „tenant“

Results: Tenants with property ownership

H4: Being a landlord makes tenants less likely to accept costly push policies

- Tenants who are landlords are less likely to accept several push policies
- The policies clearly have highly visible costs for landlords
- No comparable effects of being a landlord on owners' policy acceptance

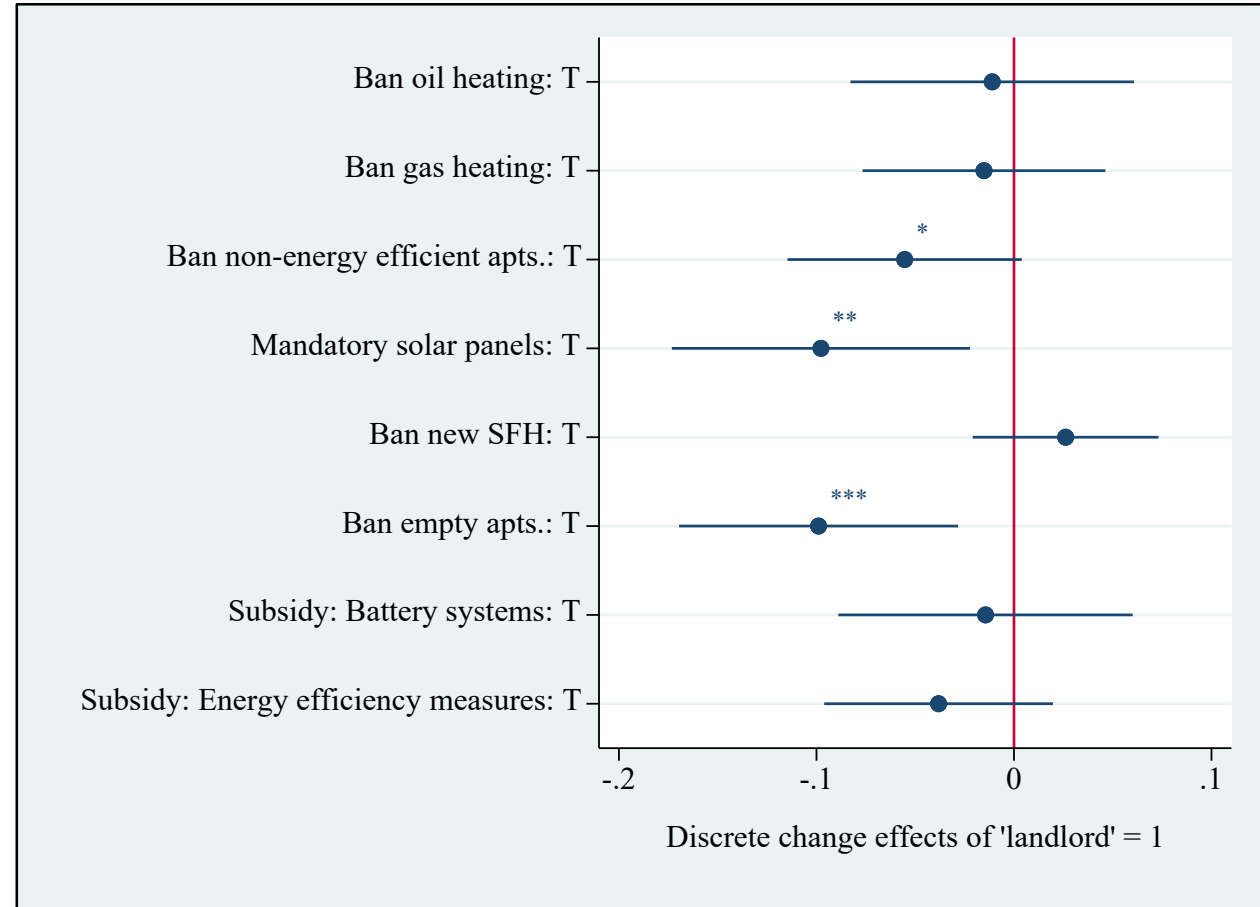

Figure 3: Estimated average discrete probability effects of „landlord“ for tenants

Results: Owners in MFH and SFH

H5: Owners in MFH are more likely to accept costly push policies compared to owners in SFH

- Owners in SFH are less likely to accept push policies
- ... and more likely to accept pull policies
- No comparable effects of home type on tenants' policy acceptance

Figure 4: Estimated average discrete probability effect of „home type“ for owners

Conclusions

Findings

- We find differences in acceptance between owners and tenants
- Excluding tenants might lead to biased results regarding policy acceptance
- Self-interest seems to be a deciding factor regarding policy acceptance

Policy implications

- Existing estimates of the acceptance of solar mandates might have been severely underestimated if tenants were not included
- Push policies might be more accepted than previously believed when targeting owner-occupied multi-family homes

Thank you for your attention!

Appendix (I)

- Framework for empirical analysis
- ABC-model (Attitude-Behavior-Context theory) (Stern (2000))
- The framework is frequently used in the literature on climate-oriented policy acceptance (e.g., Rhodes et al. (2017), Ziegler (2019), Engler et al. (2021))

- Four types of variables that explain pro-environmental behavior
 - Attitudinal factors (Values, Beliefs, Norms)
 - Contextual factors (Context of behavior)
 - Personal capabilities (Sociodemographics)
 - Habits and routines

Appendix (II)

Appendix (V)

- Robustness checks that were conducted
- Different coding of the dependent variables
 - Ordered probit with original 5-point variables
 - Binary probit with middle category added to „Rejection“
 - Linear regression
- Analysis of the marginal effects on $y = \text{„Rejection“}$ and $y = \text{„Neither agree nor disagree“}$
- Other explanatory variables (Haverkamp et al. (2022); Ziegler (2021); Albanese et al. (2017))
 - Economic preferences (risk, patience)
 - Negative and positive reciprocity
 - Subjective well-being

Appendix (VII) Differences between owners and tenants (I)

H3: Owners are less likely to accept push policies that require structural changes to their buildings compared to tenants.

- Tenants are more likely to accept almost all policies
- Largest effect: Mandatory solar panels for residential buildings (+15 pp.)

Policy	Discrete Change Effect of „tenant“
Banning new oil heating systems	0.0281* (1.70)
Banning new gas heating systems	0.0572*** (3.96)
Banning renting out apartments with low energy efficiency rating	0.0467*** (3.57)
Mandatory solar panels on residential buildings	0.152*** (8.83)
Banning the construction of new single-family homes	0.0356*** (3.77)
Banning empty apartments	0.0811*** (4.77)
Subsidy on household battery systems	0.00257 (0.14)
Subsidy on household energy efficiency measures	0.0313** (2.13)

Table 5: Discrete effects of „tenant“ = 1 on the probability of choosing „Acceptance“ (y = 3)

Appendix (VIII) Differences between owners and tenants (II)

H4: Tenants who are landlords are less likely to accept push policies that require structural changes to their buildings compared to tenants who are not landlords.

- Tenant-landlords are less likely to accept policies that target building decision makers
- No comparable effects for owners

Policy	Discrete Change Effect of „landlord“ for tenants
Banning new oil heating systems	-0.0110 (-0.30)
Banning new gas heating systems	-0.0152 (-0.48)
Banning renting out apartments with low energy efficiency rating	-0.0553* (-1.83)
Mandatory solar panels on residential buildings	-0.0977** (-2.54)
Banning the construction of new single-family homes	0.0262 (1.09)
Banning empty apartments	-0.0989*** (-2.74)
Subsidy on household battery systems	-0.0144 (-0.38)
Subsidy on household energy efficiency measures	-0.0382 (-1.29)

Table 6: Discrete effects of „landlord“ = 1 on the probability of choosing „Acceptance“ (y = 3) for tenants

Appendix (IX) Differences between owners and tenants (III)

H5: Owners who live in single-family homes are less likely to accept push policies that require structural changes to their buildings compared to owners living in single-family homes.

- Owners in single-family homes are less likely to accept most push-policies
- Owners in multi-family homes are less likely to accept subsidies
- No comparable effects for tenants

Policy	Discrete Change Effect of „home type“ = Detached SFH	Discrete Change Effect of „home type“ = Attached SFH
Banning new oil heating systems	-0.0898*** (-3.94)	-0.0614** (-2.26)
Banning new gas heating systems	-0.0508** (-2.56)	-0.0779*** (-3.45)
Banning renting out apartments with low energy efficiency rating	-0.00962 (-0.56)	0.0000560 (0.00)
Mandatory solar panels on residential buildings	-0.0536** (-2.26)	-0.0779*** (-2.87)
Banning the construction of new single-family homes	-0.0587*** (-4.93)	-0.0505*** (-3.73)
Banning empty apartments	-0.0542** (-2.29)	-0.0133 (-0.47)
Subsidy on household battery systems	0.122*** (4.84)	0.120*** (4.04)
Subsidy on household energy efficiency measures	0.0418** (2.05)	0.0573** (2.36)

Table 7: Discrete effects of „home type“ = 2 and „home type“ = 3 on the probability of choosing „Acceptance“ (y = 3) for owners

Appendix (X) Limitations

- The study design allows to identify correlations but not causal effects
- Survey studies face challenges such as ensuring that concepts expressed in the survey are properly understood by the respondents
